

Demanding Environments Demand MSI

When operating near furnaces, foundries, steel mills, and other high-temperature environments, protecting your equipment is critical. Our optional heat shield helps reduce radiant heat exposure to the crane scale, extending reliability and enabling dependable performance in demanding applications. This factory-engineered option sets our crane scales apart from many competitive offerings, giving operators greater confidence when weighing in challenging thermal environments.

Bring On the Heat

The heat shields on the MSI-4260, MSI-6360 and MSI-9600HT crane scales can withstand up to 2,950 °F (1,621 °C) direct heat from below the scale.

Duty Cycle and Cooldown Time

The heat shields on MSI crane scales have a 15-minute maximum duty cycle and equal cooldown time, meaning the crane scale can be directly above a heat source for up to 15 minutes and takes only 15 minutes to cool down after being removed from the heat source.
